

Troubleshooting Single-Area OSPFv2 and OSPFv3

Introduction

Open Shortest Path First (OSPF) is a link-state routing protocol for IP networks. OSPFv2 is defined for IPv4 networks, and OSPFv3 is defined for IPv6 networks. OSPFv2 and OSPFv3 are completely isolated routing protocols, changes in OSPFv2 do not affect OSPFv3 routing, and vice versa.

Objective(s)

In this lab the student will:

- Troubleshoot Layer 3 Connectivity
- Troubleshoot OSPFv2
- Troubleshoot OSPFv3

Equipment/Supplies Needed

If working in a physical environment:

- 3 Routers (Cisco 1941 with Cisco IOS Release 15.2(4) M3 universal image or comparable)
- 3 Cisco 2960 Switches (Software (C2960-LANBASE-M), Version 12.2)
- 3 PCs (Windows 7, Vista, or XP with terminal emulation program, such as TeraTerm)
- Console cables to configure the Cisco IOS devices via the console ports
- Ethernet and serial cables as shown in the topology

If working online:

- Your Computer workstation
- Cisco Packet Tracer (online)
- Troubleshooting Single-Area OSPFv2 and OSPFv3.pkt file

Addressing Table

Device	OSPF Router ID	Interface	IP Address	Default Gateway
R1	1.1.1.1	G0/0	192.168.1.1/24 2001:DB8:ACAD:A::1/64 FE80::1 link-local	N/A
		S0/0/0	192.168.12.1/30 2001:DB8:ACAD:12::1/64 FE80::1 link-local	N/A
		S0/0/1	192.168.13.1/30 2001:DB8:ACAD:13::1/64 FE80::1 link-local	N/A
R2	2.2.2.2	G0/0	192.168.2.1/24 2001:DB8:ACAD:B::2/64 FE80::2 link-local	N/A
		S0/0/0	192.168.12.2/30 2001:DB8:ACAD:12::2/64 FE80::2 link-local	N/A
		S0/0/1	192.168.23.1/30 2001:DB8:ACAD:23::2/64 FE80::2 link-local	N/A
R3	3.3.3.3	G0/0	192.168.3.1/24 2001:DB8:ACAD:C::3/64 FE80::3 link-local	N/A
		S0/0/0	192.168.13.2/30 2001:DB8:ACAD:13::3/64 FE80::3 link-local	N/A
		S0/0/1	192.168.23.2/30 2001:DB8:ACAD:23::3/64 FE80::3 link-local	N/A
PC-1		NIC	192.168.1.3/24 2001:DB8:ACAD:A::A/64	192.168.1.1 FE80::1

PC-2		NIC	192.168.2.3/24 2001:DB8:ACAD:B::B/64	192.168.2.1 FE80::2
PC-3		NIC	192.168.3.3/24 2001:DB8:ACAD:C::C/64	192.168.3.1 FE80::3

Topology

Procedure

Perform the steps in this lab in the order they are presented to you. Answer all questions and record the requested information in a file.

Note: All routers in the provided file have the following passwords.

Privileged Exec: **security**

Console/telnet/vty: **cyber**

Part 1: Troubleshoot Layer 3 Connectivity

In Part 1, you will verify that Layer 3 connectivity is established on all interfaces. You will need to test both IPv4 and IPv6 connectivity for all device interfaces.

Step 1: Verify that the interfaces listed in the Addressing Table are active and configured with the correct IP address information.

1. Issue the **show ip interface brief** command on all routers to verify that the interfaces are in an up/up state.

Record your findings.

```
R1#show ip interface brief
Interface                IP-Address      OK? Method Status              Protocol
GigabitEthernet0/0       192.168.1.1     YES NVRAM   administratively down down
GigabitEthernet0/1       unassigned      YES NVRAM   administratively down down
Serial0/0/0               192.168.12.1    YES manual    up                  up
Serial0/0/1               192.168.13.1    YES manual    up                  up
Vlan1                     unassigned      YES unset    administratively down down
```

2. Issue the **show interface** or **show run** command to verify IP address assignments on all router interfaces. Compare the interface IP addresses against the Addressing Table and verify the subnet mask assignments. For IPv6, verify that the link-local address has been assigned.

Record your findings.

```

!
interface GigabitEthernet0/0
 ip address 192.168.1.1 255.255.255.0
 duplex auto
 speed auto
 ipv6 address FE80::1 link-local
 ipv6 address 2001:DB8:ACAD:A::1/64
 shutdown
!
interface GigabitEthernet0/1
 no ip address
 duplex auto
 speed auto
 shutdown
!
interface Serial0/0/0
 ip address 192.168.12.1 255.255.255.0
 ipv6 address FE80::1 link-local
 ipv6 address 2001:DB8:ACAD:12::1/64
 ipv6 ospf 1 area 0
 clock rate 128000
!
interface Serial0/0/1
 ip address 192.168.13.1 255.255.255.0
 ipv6 address FE80::1 link-local
 ipv6 address 2001:DB8:ACAD:13::1/64
 ipv6 ospf 1 area 0
!
interface Vlan1
 no ip address
 shutdown
!
router ospf 1
 log-adjacency-changes
 passive-interface GigabitEthernet0/0
 network 192.168.1.0 0.0.0.255 area 0
 network 129.168.12.0 0.0.0.3 area 0
 network 192.168.13.0 0.0.0.3 area 0

```

Resolve all problems that are found. **Record the commands** used to correct the issues.

Record the commands

```

R1#config t
Enter configuration commands, one per line.  End with CNTL/Z
R1(config)#int s0/0/0
R1(config-if)#ip address 192.168.12.1 255.
^
% Invalid input detected at '^' marker.

R1(config-if)#ip address 192.168.12.1 255.255.255.252
R1(config-if)#exit
R1(config)#int s0/0/1
R1(config-if)#ip address 192.168.13.1 255.255.255.252

```

Using the **ping** command, verify that each router has network connectivity with the serial interfaces on the neighbor routers. Verify that the PCs can ping their default gateways. If problems still exist, continue troubleshooting Layer 3 issues.

Part 2: Troubleshoot OSPFv2

Step 1: Test IPv4 end-to-end connectivity.

From each PC host, ping the other PC hosts in the topology to verify end-to-end connectivity.

a. Ping from PC-1 to PC-2. Were the pings successful? _____yes_____

b. Ping from PC-1 to PC-3. Were the pings successful? _____yes_____

c. Ping from PC-2 to PC-3. Were the pings successful? _____No_____

Step 2: Verify that all interfaces are assigned to OSPFv2 area 0 on R1

1. Issue the **show ip protocols** command to verify that OSPF is running and that all networks are advertised in area 0. Verify that the router ID is set correctly.

Record your findings.

```
R1#show ip protocols

Routing Protocol is "ospf 1"
  Outgoing update filter list for all interfaces is not set
  Incoming update filter list for all interfaces is not set
  Router ID 192.168.13.1
  Number of areas in this router is 1. 1 normal 0 stub 0 nssa
  Maximum path: 4
  Routing for Networks:
    192.168.1.0 0.0.0.255 area 0
    129.168.12.0 0.0.0.3 area 0
    192.168.13.0 0.0.0.3 area 0
  Passive Interface(s):
    GigabitEthernet0/0
  Routing Information Sources:
    Gateway         Distance      Last Update
    192.168.13.1      110          00:04:11
  Distance: (default is 110)
```

2. Make the necessary changes to the configuration on R1 based on the output from the **show ip protocols** command. **Record the commands** used to correct the issues.

Record the commands

```
R1#config t
Enter configuration commands, one per line. End with CNTL/Z.
R1(config)#router ospf 1
R1(config-router)#network 192.168.12.0 0.0.0.3 area 0
R1(config-router)#
00:16:55: %OSPF-5-ADJCHG: Process 1, Nbr 192.168.12.2 on Serial0/0/0 from LOADING to FULL, Loading Done
R1(config-router)#router-id 1.1.1.1
```

```
R1#show ip protocols

Routing Protocol is "ospf 1"
  Outgoing update filter list for all interfaces is not set
  Incoming update filter list for all interfaces is not set
  Router ID 1.1.1.1
  Number of areas in this router is 1. 1 normal 0 stub 0 nssa
  Maximum path: 4
  Routing for Networks:
    192.168.1.0 0.0.0.255 area 0
    192.168.13.0 0.0.0.3 area 0
    192.168.12.0 0.0.0.3 area 0
  Passive Interface(s):
    GigabitEthernet0/0
  Routing Information Sources:
    Gateway         Distance      Last Update
    1.1.1.1          110          00:00:10
    2.2.2.2          110          00:00:10
    192.168.12.2     110          00:13:01
    192.168.13.1     110          00:00:50
  Distance: (default is 110)
```

3. Issue the **clear ip ospf process** command if necessary.
4. Re-issue the **show ip protocols** command, verify that your changes had the desired effect, all interfaces are listed as OSPF networks assigned to area 0 , and verify that G0/0 is a passive interface

5. Resolve any problems discovered on R1. List any additional changes made to R1. If no problems were found on the device, then respond with "no problems were found". **No Problems were found**

Step 3: Verify that all interfaces are assigned to OSPFv2 area 0 on R2

1. Issue the **show ip protocols** command to verify that OSPF is running and that all networks are being advertised in area 0. Verify that the router ID is set correctly.

Record your findings.

```
R2#show ip protocols

Routing Protocol is "ospf 1"
  Outgoing update filter list for all interfaces is not set
  Incoming update filter list for all interfaces is not set
  Router ID 192.168.12.2
  Number of areas in this router is 1. 1 normal 0 stub 0 nssa
  Maximum path: 4
  Routing for Networks:
    192.168.2.0 0.0.0.255 area 0
    192.168.12.0 0.0.0.3 area 0
    192.168.23.0 0.0.0.3 area 0
```

2. Make the necessary changes to the configuration on R2 based on the output from the **show ip protocols** command. **Record the commands** used to correct the issues

Record the commands

```
R2#config t
Enter configuration commands, one per line.  End with CNTL/Z.
R2(config)#router ospf 1
R2(config-router)#router-id 2.2.2.2
R2(config-router)#Reload or use "clear ip ospf process" command, for this to take effect
```

```
R2#config t
Enter configuration commands, one per line.  End with CNTL/Z.
R2(config)#router ospf 1
R2(config-router)#passive-int g0/0
R2(config-router)#exit
```

```

R2#show ip protocols

Routing Protocol is "ospf 1"
  Outgoing update filter list for all interfaces is not set
  Incoming update filter list for all interfaces is not set
  Router ID 2.2.2.2
  Number of areas in this router is 1. 1 normal 0 stub 0 nssa
  Maximum path: 4
  Routing for Networks:
    192.168.2.0 0.0.0.255 area 0
    192.168.12.0 0.0.0.3 area 0
    192.168.23.0 0.0.0.3 area 0
  Passive Interface(s):
    GigabitEthernet0/0
  Routing Information Sources:
    Gateway         Distance      Last Update
    1.1.1.1          110          00:04:25
    2.2.2.2          110          00:04:25
    192.168.12.2     110          00:17:16
    192.168.13.1     110          00:05:05
  Distance: (default is 110)

```

3. Issue the **clear ip ospf process** command if necessary.
4. Re-issue the **show ip protocols** command to verify that your changes had the desired effect. Verify that all interfaces are listed as OSPF networks assigned to area 0 and verify that G0/0 is a passive interface.
5. Resolve any problems discovered on R2. List any additional changes made to R2. If no problems were found on the device, then respond with "no problems were found". **Int g0/0 had the wrong link local address and int s0/0/1 was down and did not have an ipv4 address assigned**

Step 4: Verify that all interfaces are assigned to OSPFv2 area 0 on R3.

1. Issue the **show ip protocols** command to verify that OSPF is running and that all networks are being advertised in area 0. Verify that the router ID is set correctly as well

Record your findings.

```

R3#show ip protocols

Routing Protocol is "ospf 1"
  Outgoing update filter list for all interfaces is not set
  Incoming update filter list for all interfaces is not set
  Router ID 192.168.13.1
  Number of areas in this router is 1. 1 normal 0 stub 0 nssa
  Maximum path: 4
  Routing for Networks:
    192.168.3.0 0.0.0.255 area 0
  Passive Interface(s):
    GigabitEthernet0/0
  Routing Information Sources:
    Gateway         Distance      Last Update
  Distance: (default is 110)

```

2. Make the necessary changes to the configuration on R3 based on the output from the **show ip protocols** command. **Record the commands** used to correct the issues.

Record the commands

```

R3#config t
Enter configuration commands, one per line.  End with CNTL/Z.
R3(config)#router ospf 1
R3(config-router)#network 192.168.13.0 0.0.0.3
% Incomplete command.
R3(config-router)#192.168.13.0 0.0.0.3
^
% Invalid input detected at '^' marker.

R3(config-router)#192.168.13.0 0.0.0.3 area 0
^
% Invalid input detected at '^' marker.

R3(config-router)#network 192.168.13.0 0.0.0.3 area 0
R3(config-router)#network 192.168.13.0 0.0.0.3 area 0
01:18:38: %OSPF-5-ADJCHG: Process 1, Nbr 1.1.1.1 on Serial0/0/0 from LOADING to FULL,
Loading Done

R3(config-router)#network 192.168.23.0 0.0.0.3 area 0
R3(config-router)#exit

~*~
R3#config t
Enter configuration commands, one per line.  End with CNTL/Z.
R3(config)#router ospf 1
R3(config-router)#router-id 3.3.3.3
R3(config-router)#Reload or use "clear ip ospf process" command, for this to take effect

R3(config-router)#end

```

```

R3#show ip protocols

Routing Protocol is "ospf 1"
  Outgoing update filter list for all interfaces is not set
  Incoming update filter list for all interfaces is not set
  Router ID 3.3.3.3
  Number of areas in this router is 1. 1 normal 0 stub 0 nssa
  Maximum path: 4
  Routing for Networks:
    192.168.3.0 0.0.0.255 area 0
    192.168.13.0 0.0.0.3 area 0
    192.168.23.0 0.0.0.3 area 0
  Passive Interface(s):
    GigabitEthernet0/0
  Routing Information Sources:
    Gateway         Distance      Last Update
    1.1.1.1          110          00:01:01
    2.2.2.2          110          00:23:43
    3.3.3.3          110          00:01:01
    192.168.12.2     110          00:36:34
    192.168.13.1     110          00:24:23
  Distance: (default is 110)

```

3. Issue the **clear ip ospf process** command if necessary.
4. Re-issue the **show ip protocols** command to verify that your changes had the desired effect. Verify that all interfaces are listed as OSPF networks assigned to area 0 and verify that G0/0 is a passive interface.
5. Resolve any problems discovered on R3. List any additional changes made to R3. If no problems were found on the device, then respond with "no problems were found". **Int s0/0/0 had the wrong Ipv4 address, int s0/0/1 was down , int g0/0 had no ipv4 address and was down**

Step 5: Verify OSPF neighbor information.

1. Issue the **show ip ospf neighbor** command on all routers to view the ospf neighbor information.

Step 6: Verify OSPFv2 Routing Information

1. Issue the **show ip route ospf** command to verify that each router has OSPFv2 routes to all non-adjointing networks.

Are all OSPFv2 routes available? Yes

If any OSPFv2 routes are missing, what is missing? none

Step 7: Verify IPv4 end-to-end connectivity.

From each PC, verify that IPv4 end-to-end connectivity exists. PCs should be able to ping the other PC hosts in the topology. If IPv4 end-to-end connectivity does not exist, then continue troubleshooting to resolve any remaining issues.

Part 3: Troubleshoot OSPFv3

In Part 4, you will troubleshoot OSPFv3 problems and make the necessary changes needed to establish OSPFv3 routes and end-to-end IPv6 connectivity.

Note: LAN (G0/0) interfaces should not advertise OSPFv3 routing information, but routes to these networks should be contained in the routing tables.

Step 1: Test IPv6 end-to-end connectivity.

From each PC host, ping the IPv6 addresses of the other PC hosts in the topology to verify IPv6 end-to-end connectivity.

Step 2: Verify that IPv6 unicast routing has been enabled on all routers

1. An easy way to verify that IPv6 routing has been enabled on a router is to use the **show run** and look for the **ipv6 unicast-routing** command. The **ipv6 unicast-routing** command displays if IPv6 routing has been enabled.
2. If IPv6 unicast routing is not enabled on one or more routers, enable it now. Record the commands used to correct the issues.

```
R3#config t
Enter configuration commands, one per line. End with CNTL/Z.
R3(config)#ipv6 unicast-routing
R3(config)#end
```

Step 3: Verify that all interfaces are assigned to OSPFv3 area 0 on R1

1. Issue the **show ipv6 protocols** command and verify that the router ID is correct. Also verify that the expected interfaces are displayed under area 0.

Note: If no output is generated from this command, then the OSPFv3 process has not been configured. Record your findings.

```
Enter Configuration Commands, one per line
R1(config)#show ipv6 protocols
^
% Invalid input detected at '^' marker.
```

2. Make the necessary configuration changes to R1. **Record the commands** used to correct the issues.

Record the commands

```

R1(config)#ipv6 router ospf 1
R1(config-rtr)#router-id 1.1.1.1
Reload or use "clear ipv6 ospf process" command, for this to take effect
R1(config-rtr)#exit
R1(config)#int g0/0
R1(config-if)# ipv6 ospf 1 area 0
R1(config-if)#exit
R1(config)#int s0/0/0
R1(config-if)# ipv6 ospf 1 area 0
R1(config-if)#exit
R1(config)#int s0/0/1
R1(config-if)# ipv6 ospf 1 area 0
R1(config-if)#exit
R1(config)#exit
R1#
%SYS-5-CONFIG_I: Configured from console by console

R1#config t
Enter configuration commands, one per line. End with CNTL/Z.
R1(config)#exit
R1#
%SYS-5-CONFIG_I: Configured from console by console

R1#show ipv6 protocols
IPv6 Routing Protocol is "connected"
IPv6 Routing Protocol is "ND"
IPv6 Routing Protocol is "ospf 1"
  Interfaces (Area 0)
    Serial0/0/0
    Serial0/0/1
    GigabitEthernet0/0
  Redistribution:
    None

```

```

R1#show ipv6 ospf interface g0/0
GigabitEthernet0/0 is up, line protocol is up
  Link Local Address FE80::1, Interface ID 1
  Area 0, Process ID 1, Instance ID 0, Router ID 1.1.1.1
  Network Type BROADCAST, Cost: 1
  Transmit Delay is 1 sec, State DR, Priority 1
  Designated Router (ID) 1.1.1.1, local address FE80::1
  No backup designated router on this network
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    No Hellos (Passive interface)
  Index 3/3, flood queue length 0
  Next 0x0(0)/0x0(0)
  Last flood scan length is 1, maximum is 1
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 0, Adjacent neighbor count is 0
  Suppress hello for 0 neighbor(s)

```

3. Issue the **clear ipv6 ospf** process command if necessary
4. Re-issue the **show ipv6 protocols** command to verify that your changes had the desired effect.
5. Verify that all interfaces are listed as OSPF networks assigned to area 0. Verify that the G0/0 interface is set not to advertise.
6. Resolve any problems discovered on R1. List any additional changes made to R1. If no problems were found on the device, then respond with "no problems were found". **No problems found**

Step 4: Verify that all interfaces are assigned to OSPFv3 area 0 on R2.

1. Issue the **show ipv6 protocols** command and verify the router ID is correct. Also verify that the expected interfaces display under area 0.

Note: If no output is generated from this command, then the OSPFv3 process has not been configured.

Record your findings.

```

  Transmit Delay is 1 sec, State WAITING, Priority 1
  No designated router on this network
  No backup designated router on this network
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    No Hellos (Passive interface)
  Index 2/2, flood queue length 0
  Next 0x0(0)/0x0(0)
  Last flood scan length is 1, maximum is 1
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 0, Adjacent neighbor count is 0
  Suppress hello for 0 neighbor(s)

```

3. Issue the **clear ipv6 ospf process** command if necessary.
4. Re-issue the **show ipv6 protocols** command to verify that your changes had the desired effect.
5. Verify that all interfaces are listed as OSPF networks assigned to area 0. Verify that the G0/0 interface is set not to advertise.
6. Resolve any problems discovered on R2. List any additional changes made to R2. If no problems were found on the device, then respond with "no problems were found". **No problems were found**
7. List any additional changes made to R2. If no problems were found on the device, then respond with "no problems were found". **No Problems were found**

Step 5: Verify that all interfaces are assigned to OSPFv3 area 0 on R3

1. Issue the **show ipv6 protocols** command and verify that the router ID is correct. Also verify that the expected interfaces display under area 0.

Note: If no output is generated from this command, then the OSPFv3 process has not been configured.

Record your findings

```
R3>en
Password:
R3#show ipv6 protocols
IPv6 Routing Protocol is "connected"
IPv6 Routing Protocol is "ND"
R3#
```

2. Make the necessary configuration changes to R3. **Record the commands** used to correct the issues.

Record the commands

```
R3#config t
Enter configuration commands, one per line. End with CNTL/Z.
R3(config)#int g0/0
R3(config-if)# ipv6 ospf 1 area 0
R3(config-if)#int s0/0/0
R3(config-if)# ipv6 ospf 1 area 0
R3(config-if)#int s0/0/1
R3(config-if)# ipv6 ospf 1 area 0
R3(config-if)#
02:24:30: %OSPFv3-5-ADJCHG: Process 1, Nbr 1.1.1.1 on Serial0/0/0 from LOADING to FULL,
Loading Done

R3(config-if)#exit
R3(config)#ipv6 rou
02:24:37: %OSPFv3-5-ADJCHG: Process 1, Nbr 2.2.2.2 on Serial0/0/1 from LOADING to FULL,
Loading Done

R3(config)#ipv6 router ospf 1
R3(config-rtr)#passive-int g0/0
R3(config-rtr)#end
R3#
%SYS-5-CONFIG_I: Configured from console by console
```

```
R3#show ipv6 protocols
IPv6 Routing Protocol is "connected"
IPv6 Routing Protocol is "ND"
IPv6 Routing Protocol is "ospf 1"
  Interfaces (Area 0)
    GigabitEthernet0/0
    Serial0/0/0
    Serial0/0/1
  Redistribution:
    None
```

```
[OK]
R3#show ipv6 ospf interface g0/0
GigabitEthernet0/0 is up, line protocol is up
  Link Local Address FE80::3, Interface ID 1
  Area 0, Process ID 1, Instance ID 0, Router ID 192.168.23.2
  Network Type BROADCAST, Cost: 1
  Transmit Delay is 1 sec, State WAITING, Priority 1
  No designated router on this network
  No backup designated router on this network
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    No Hellos (Passive interface)
  Index 1/1, flood queue length 0
  Next 0x0(0)/0x0(0)
  Last flood scan length is 1, maximum is 1
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 0, Adjacent neighbor count is 0
  Suppress hello for 0 neighbor(s)
```

3. Issue the **clear ipv6 ospf process** command if necessary.
4. Re-issue the **show ipv6 protocols** command to verify that your changes had the desired effect.
5. Verify that all interfaces are listed as OSPF networks assigned to area 0. Verify that the G0/0 interface is set not to advertise.
6. Resolve any problems discovered on R3. List any additional changes made to R3. If no problems were found on the device, then respond with "no problems were found". **no problems were found**
7. List any additional changes made to R3. If no problems were found on the device, then respond with "no problems were found". **no problems were found**

Step 6: Verify that all routers have correct neighbor adjacency information

1. Issue the **show ipv6 ospf neighbor** command to verify that adjacencies have formed between neighboring routers.

2. Resolve any OSPFv3 adjacency issues that still exist **Step 7:** Verify

OSPFv3 routing information.

a. Issue the **show ipv6 route ospf** command, and verify that OSPFv3 routes exist to all non-adjointing networks

Questions

Are all OSPFv3 routes available? yes

If any OSPFv3 routes are missing, what is missing? no

b. Resolve any routing issues that still exist.

Step 8: Verify IPv6 end-to-end connectivity.

From each PC, verify that IPv6 end-to-end connectivity exists. PCs should be able to ping each interface on the network. If IPv6 end-to-end connectivity does not exist, then continue troubleshooting to resolve remaining issues.

Reflection

Why would you troubleshoot OSPFv2 and OSPFv3 separately? Troubleshooting OSPFv2 and OSPFv3 separately ensures that the specific characteristics and requirements of each protocol version are addressed properly

Submit Your Work:

Submit all text files, screenshots, or answers to questions to your instructor Using the most appropriate method below.

Packet Tracer:

Submit Packet Tracer file as well as your text file with your findings and notes.

Rubric

Checklist/Single Point Mastery

<u>Concerns</u> Working Towards Proficiency	<u>Criteria</u> Standards for This Competency	<u>Accomplished</u> Evidence of Mastering Competency
	Criteria #1: Verify that all interfaces are assigned to OSPFv2 area 0 on R1 (10 pts)	Discover issue on Router 1 and correct the problem. (OSPFv2) (10 pts)
	Criteria #2: Discover issue on Router 2 and correct the problem (OSPFv2) (10 pts)	Discover issue on Router 2 and correct the problem (OSPFv2) (10 pts)
	Criteria #3: Discover issue on Router 3 and correct the problem (OSPFv2) (10 pts)	Discover issue on Router 3 and correct the problem (OSPFv2) (10 pts)
	Criteria #4: Verify that IPv6 unicast routing has been enabled on all routers (10 pts)	Verify that IPv6 unicast routing has been enabled on all routers (10 pts)
	Criteria #5: Verify that all interfaces are assigned to OSPFv3 area 0 on R3 (10 pts)	Verify that all interfaces are assigned to OSPFv3 area 0 on R3 (10 pts)
	Criteria #6: Test connectivity between all remote networks using ping. (10 pts)	Test connectivity between all remote networks using ping. (10 pts) 3 remote networks (3.3 pts)
	Criteria #7: Submit instructions document with lab questions and documentation completed. (40 pts)	Criteria #5: Submit instructions document with lab questions and documentation completed. (40 pts)
